Targeting peptides identified by phage display, useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, inflammatory or autoimmune diseases, infections or cardiovascular disease.

Claim 22; Page 109; 317pp; English.

The invention relates to an isolated peptide of 100 amino acids or less in size useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, archritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with ischaemia, cancer, arthritis, diabetes, cardiovascular disease.

The present invention describes a method for treating obesity or a lipodystropathy, which comprises: (a) obtaining a targeting peptide selective for adipose tissue; (b) attaching the peptide to a therapeutic agent to form a complex; (c) administering the complex to a subject; and (d) inducing weight loss in the subject or treating lipodystropathy. The adipose targeting peptides have anorectic and antilipaemic activities, and can be used in peptide and gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immunodeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teracogenic activity. ABRS6806 to ABRS6827, and ACC79106 to ACC79111 represent sequences used in the
           for diagnosing the diseases citted above. Targeting peptides of the invention can also be used to deliver an agent to a foetus, by attaching a peptide to the agent and administering the peptide to a pregnant subject. Sequences ABG60326-ABG60574 represent selective targeting peptides of the invention
inflammation or macular degeneration. Furthermore, the peptide is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptide therapy; gene therapy; infection; human immunodeficiency virus; HIV; placental delivery; teratogenic; placenta; adipose; pancreatic; beta-3 integrin; beta-5 integrin; spleen; aminopeptidase A.

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid concluded are: (2) a host cell containing the vector; (3) an isolated concluded or its fragment whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding colliferation or the activity of against a biological pathway in colliferation or the activity of against a biological pathway or required for proliferation, (7) identifying a compound that inhibits cellular proliferation; (8) identifying a gene product or that has an activity against a biological pathway or required for proliferation, or that inhibits cellular proliferation of an identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibicitic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent or organism acts; (9) manufacturing an antibicitic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the culture complement or collection of strains; or (13) identifying the target of a compound that inhibits the culture complement or collection of strains; or (13) identifying the target of a compound that inhibits the captured for cultured concludes are useful for identifying proteins or screening for homologous nucleic acids are useful for cellular proliferation to isolate can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense nucleic acids, useful for identifying proteins or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 25; SEQ ID NO 48817; 1766pp; English.

The peptide is also useful for inducing apoptosis, particularly to a subject with inflammation or macular degeneration. Furthermore, the peptide is useful for diagnosing the disease cited above. Targeting peptide is useful invention can also be used to deliver an agent to a foetus, by attaching a peptide to the agent and administering the peptide to a pregnant subject. Sequences ABG60326-ABG60574 represent selective targeting peptides of the invention
drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at from part of the printed secuences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Targeting peptide; cancer; arthritis; diabetes; inflammatory disease; atherosclerosis; autoimmune disease; bacterial infection; apoptosis; viral infection; acardiovascular disease; degenerative disease; ischaemia; inflammation; macular degeneration; antiinflammatory; antidiabetic; cardiovascular; immunomodulator; antibacterial; antiviral; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Targeting peptides identified by phage display, useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, inflammatory or autoimmune diseases, infections or cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lipodystropathy, which comprises: (a) obtaining a targeting peptide selective for adipose tissue; (b) attaching the peptide to a therapeutic agent to form a complex; (c) adminisering the complex to a subject; and (d) inducing weight loss in the subject or treating lipodystropathy. The adipose targeting peptides have anorectic and antilipaemic activities, and can be used in peptide and gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immunodeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teratogenic activity. ABRS6806 to ABRS6807 and ACC79106 to ACC7911 represent sequences used in the

Tumour homing molecules and their conjugates - useful for, e g. directing linked moiety to tumour containing angiogenic vasculature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present peptide represents a tumour homing peptide, and is produced by in vivo panning. The peptide homes to a breat carcinoma. The in vivo panning comprises administering a library of diverse peptides to a subject having a tumour, collecting a sample of the tumour, identifying a peptide that homes to the tumour, collecting a sample of normal tissue corresponding to the tumour, and determining that the peptide that homes to the tumour is not present in the normal lissue. The tumour homins peptide can be linked to a moiety (e.g. doxorubicin), and used to direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tumour homing peptide; tumour; diagnosis; endothelial cell; breast; andiogenic vasulature; anti-tumour; anti-inflammatory; anti-angiogenic; anti-arthritic; NGR receptor; inhibitor; angiogenesis; anticancer drug; prognosis; inflammation; regeneration; wounded tissue; targetting; macular degeneration; diabetic retinopathy; rheumatoid arthritis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This synthetic peptide is a claimed example of a breast tumour-homing peptide that was identified using a novel method for obtaining molecules that home to a selected organ or tissue. This in vivo panning method typically involves administering a phage display library to a subject, and identifying expressed peptides which home to the desired organ or tissue, e.g. brain, kidney, angiogenic vacular tissue or tumour tissue. The isolated peptides (see AAW13412-52, AAW1181-86) can be used to target e.g. drugs, toxins or labble to the selected organ/tissue (claimed) or to identify and/or isolate target molecules (claimed). The peptides can be directly identified in vivo, as compared to prior art in vitro screening methods, which require further examination to see if they maintain specificity in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Obtaining compound that homes to selected organ or tissue - by in vivo panning method, specifically to identify brain, kidney, angiogenic vasculature or tumour tissue homing peptide(s).

                                                                                                                                                                        vasculature, specifically of a tumour and which have anti-tumour, anti-
inflammatory, anti-angiogenic and anti-arthritic activity. Such molecules
are identified by treating a purified NGR receptor with a test compound
and identifying compounds that bind specifically to the NGR receptor. The
peptides of the invention are inhibitors of angiogenesis and can be used
to produce conjugates for delivering agents to angiogenic vasculature,
particularly anticancer drugs or an imaging agent, for diagnosis or
prognosis. These conjugates may be directed to non-tumour angiogenic
to prognosis. These conjugates may be directed to non-tumour angiogenic
corrections. The present in inflammatory, regenerating or wounded
tissue, e.g. for treatment of macular degeneration, diabetic retinopathy
or rheumatoid arthritis. The peptides provide specific targeting to
theorem to arthritis. The peptides provide specific targeting to
the seposed to the circulation only in angiogenic vasculature. Precise
targeting should reduce the systemic toxicity of anticancer drugs in the
conjugates. Complete killing of all target cells may not be essential
since partial denudation of endothelium may result in an occlusive
thrombus, and endothelial cells are unlikely to become resistant to
anticancer agents nor to lose the targeting receptor. AAM93622-W93809 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each
confidently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-
(L2)d-P2-(L3)e-P3, or -(L1)c-P1, -(L3)c-P3-(L4)f-P4 where P1, P2,
C1 (L2)d-P2-(L3)e-P3, or -(L1)c-P1, -(L3)d-P3-(L4)f-P4 where P1, P2,
C2 (L2)d-P2-(L3)e-P3, or -(L1)c-P1, -(L2)d-P2-(L3)f-P3-(L4)f-P4 where P1, P2,
C3 and P4 = are each independently sequences of pharmacologically active
C3 and b is 1. The composition can have cytostatic, antiasthmatic,
C4 c and b is 1. The composition can have cytostatic, antiasthmatic,
C5 d and b is 1. The composition can have cytostatic, antiasthmatic,
C6 and b is 1. The composition can be used for producing pharmaceutical
C6 compositions. The compositions are useful for treating cancer, asthma,
C7 thrombosis, or autoimmune diseases. The use of an Fc domain (rather than
C7 a Fab domain) can provide a longer half-life or incorporate functions
C8 cuch as Pc receptor binding, protein A binding, complement fixation, and
C7 AAB18013 represent nucleotide and amino acid sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                             Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TFO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.

The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is human breast tumour homing peptide. This sequence is useful in the homing of pro-apoptotic conjugates of the invention The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is a homing peptide isolated in the present invention, which can be conjugated to an antimicrobial peptide to make the homing pro-apoptotic conjugates of the present invention Chimeric prostate-homing pro-apoptotic peptide; prostate-homing peptide; antimicrobial peptide; prostate cancer; breast tumour homing molecule; cytostatic; human. Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide. Score 50; DB 3; Length 13; Pred. Where (I) is:

(X1)a-F1 (X2)b, where: F1 = an FC domain, X1 and X2 = are each independently selected from - (L1)C-F1, -(L1)C-P1, -(L2)d-P2, -(L1)C-P1.

(L2)d-P2-(L3)e-P³, or -(L1)C-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, CC (L2)d-P2-(L3)e-P³, and L4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, CC c, d, e, and f = are each independently 0 or 1, provided that at least 1, CC d and b is 1. The composition can have cytostatic, antiasthmatic, chrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, chrombosis, or autoimmune diseases. The use of an FC domain (rather than a FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent mucleocides and amino acid sequences used in the composition of the present invention ö Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases. The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are compounds on laminin or saw-scaled viper echistatin and target integrin, selectin or vinculin. Also included are compounds of formula (Ia) and their multimers (X1) a-F¹-(X²) b where; F¹ = Fc domain; X¹ and X² = (I²¹) c-P¹-(I²¹) a-F¹-(I²²) d-P²-(I²¹) e-P²-(I²²) e-P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      quickly in vivo). The present invention describes a vehicle-peptide molecule (1) or its multimers. (1) can have antininflammatory, antitumour, immunosuppressive, cytostaric, antirhenumatic, antiarchritic, antidiabetic, ophthalmological, antianaemic, anorectic, antininfertility, hemostaric, dermatological, cantianaemic, anorectic, antininfertility, hemostaric, dermatological and neuroprotective activities. (1) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (1) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (1) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, infertility, and neurological degenerative diseases, (1), comporters, infertility, and neurological degenerative diseases, (1), comporters, infertility, and neurological degenerating disorders characterised by low red blood cell levels such as anaemia. The TPO-mimetic comprising compounds are useful for treating disorders characterised by low megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet tumour which result in thrombocytopaenia, spistemic lupus erythematosus,
                                                                                                                                                                                                                                                                                                                                                                                            Modified peptide; mimetic; Fc domain; fusion; immunoglobulin G; IgG; EPO; erythropoietin; TPO; tumour necrosis factor alpha inhibitor; TPO; tumour necrosis factor alpha inhibitor; TPO; tumour nemargonist; IL-1 antagonist; TPO mimetic peptide; EPO mimetic peptide; EPM; VEGF antagonist; TPO mimitic peptide; MMP inhibitor; antiinflammatory; antitumour; immunosuppressive; cytostatic; antitheumatic; antiarthritic; antidiabetic; ophthalmological; antianemmic; antinflammatory disease; autoimmune disease; tumour growth; cancer; rheumatoid arthritis; diabetic retinopathy; infertility; obesity; sleep disorder; neurological degenerative disease; anaemia;

fragment where a protein has been inserted into, or replaces a portion of a heavy chain or light chain variable regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR) The present invention describes human mimetibodies, including modified immunoslobulins and cleavage products that can be useful in gene therapy and the generation of transgenic preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is an integrin binding peptide sequence used to make a

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster FILE REFERENCE: File Reference: 7326-094

CURRENT PALLION NUMBER: US/09/270,767

CURRENT PILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 42488

LENGTH: 118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
